

Project Title: G11 - AGI-Inspired Desktop Intelligence Agent **Developer:** Jeevan Kumar
Category: AGI-Inspired Desktop Intelligence **Submission Date:** February 11, 2026

1. Project Overview

G11 is a privacy-first, local desktop agent designed to bridge the gap between static AI tools and autonomous AGI-like behavior. Built for the modern professional, it operates across multiple domains—web search, file management, and system control—using a unified "Think-Act-Observe" execution loop.

2. Core Problem Solved

Modern professionals are often bogged down by manual context-switching between emails, search engines, and local file systems. G11 addresses this by:

- **Generalizing across domains:** Managing local tasks and web-based research simultaneously.
- **Retaining Context:** Using agentic reasoning to understand complex, multi-step user intents.
- **Privacy-First Architecture:** Utilizing local LLMs to ensure sensitive professional data remains on-device.

3. Technical Stack

- **Brain:** Ollama (Qwen 2.5 Coder 7B) for high-reasoning code and logic capabilities.
- **Framework:** LangChain 1.0 & LangGraph for the ReAct (Reasoning and Acting) architecture.
- **Real-time Intelligence:** Linkup Search API for agentic, sourced web-search capabilities.
- **System Tools:** Python-based automation for file I/O and OS-level application management.

4. AGI-Like Characteristics

- **Goal Decomposition:** G11 can take a high-level command (e.g., "Find the registration deadline and save it to a file") and break it into sequential tool calls.
- **Autonomous Planning:** The agent decides which tool to use based on the real-time observation of previous steps.
- **Tool Synthesis:** Seamlessly combining Linkup search results with local system commands.

5. Future Roadmap

- **Phase 3:** Integration of persistent Vector Memory (ChromaDB) for long-term user context.
- **Phase 4:** Transitioning to a 3D User Interface built with Three.js.
- **Phase 5:** Vision-language model integration for real-time screen understanding and humanoid robotics control.
